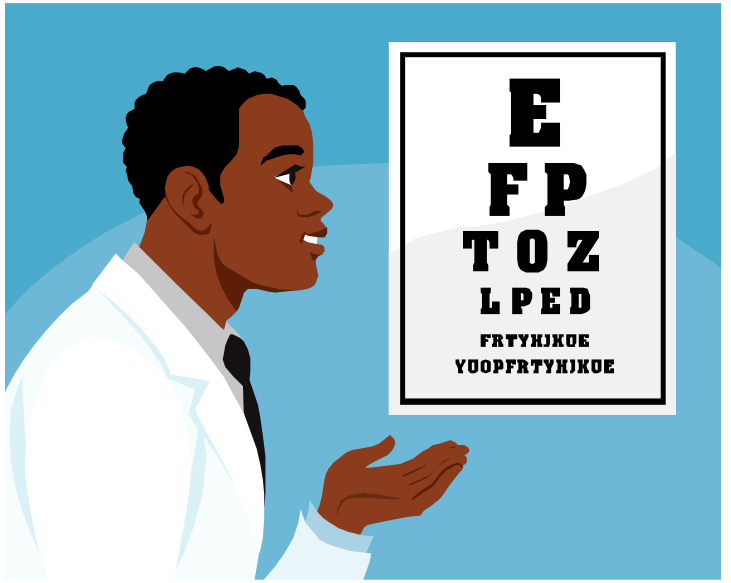
Vision & The Eye



What is “perfect vision”?

- No such thing.

20/20 = good, healthy “normal” vision

First #=distance <u>you</u> see an object from.
Second #=distance a “normal sighted” person would clearly see the object

<u>Examples</u>:

- **20/15**—you would be able to see at 20 feet what a “normal” person could only see at 15 feet (better than average).
- **20/40**—you would be able to see at 20 feet what a “normal” person could see from 40 feet (worse than average).
- **20/200**—legally blind (you could only see from 20 feet what a “normal” person could see from 200 feet).
